

Contents

I Introduction to Numerical Methods in Physics	1
1 Introduction	3
1.1 Choice of programming language	5
1.2 Designing programs	6
2 Introduction to C++ and Fortran 90/95	9
2.1 Getting started	9
2.1.1 Representation of integer numbers	14
2.2 Real numbers and numerical precision	18
2.2.1 Representation of real numbers	19
2.2.2 Further examples	27
2.3 Loss of precision	30
2.3.1 Machine numbers	30
2.4 Additional features of C++ and Fortran 90/95	31
2.4.1 Operators in C++	31
2.4.2 Pointers and arrays in C++	33
2.4.3 Macros in C++	35
2.4.4 Structures in C++ and TYPE in Fortran 90/95	36
3 Numerical differentiation	39
3.1 Introduction	39
3.2 Numerical differentiation	39
3.2.1 The second derivative of e^x	43
3.2.2 Error analysis	53
3.3 How to make figures with Gnuplot	55
4 Linear algebra	59
4.1 Introduction	59
4.2 Mathematical intermezzo	60
4.3 Programming details	64
4.3.1 Declaration of fixed-sized vectors and matrices	65
4.3.2 Runtime declarations of vectors and matrices in C++	65
4.3.3 Matrix operations and C++ and Fortran 90/95 features of matrix handling	70
4.4 Linear Systems	74
4.4.1 Gaussian elimination	76
4.4.2 LU decomposition of a matrix	79

Contents

4.4.3 Solution of linear systems of equations	84
4.4.4 Inverse of a matrix and the determinant	85
4.4.5 Tridiagonal systems of linear equations	90
4.5 Singular value decomposition	92
4.6 QR decomposition	92
4.7 Handling sparse matrices	92
4.8 Classes, templates and Blitz++	92
4.8.1 The Complex class	94
4.9 Single-value decomposition	102
4.10 QR decomposition	102
4.11 Physics project, the one-dimensional Poisson equation	102
4.11.1 Solution to exercise c)	105
5 Non-linear equations and roots of polynomials	109
5.1 Introduction	109
5.2 Iteration methods	110
5.3 Bisection method	112
5.4 Newton-Raphson's method	113
5.5 The secant method and other methods	116
5.5.1 Calling the various functions	118
6 Numerical interpolation, extrapolation and fitting of data	119
6.1 Introduction	119
6.2 Interpolation and extrapolation	119
6.2.1 Polynomial interpolation and extrapolation	119
6.3 Richardson's deferred extrapolation method	122
6.4 Qubic spline interpolation	123
7 Numerical integration	127
7.1 Introduction	127
7.2 Newton-Cotes quadrature: equal step methods	127
7.2.1 Romberg integration	133
7.3 Gaussian quadrature	133
7.3.1 Orthogonal polynomials, Legendre	137
7.3.2 Mesh points and weights with orthogonal polynomials	139
7.3.3 Application to the case $N = 2$	140
7.3.4 General integration intervals for Gauss-Legendre	142
7.3.5 Other orthogonal polynomials	142
7.3.6 Applications to selected integrals	144
7.4 Treatment of singular Integrals	146
7.5 Adaptive quadrature methods	148
7.6 Multi-dimensional integrals	148
7.7 Parallel computing	149
7.7.1 Brief survey of supercomputing concepts and terminologies	149
7.7.2 Parallelism	150
7.7.3 MPI with simple examples	152
7.7.4 Numerical integration with MPI	157

Contents

7.8	Physics project: quantum mechanical scattering via integral equations	161
8	Outline of the Monte-Carlo strategy	163
8.1	Introduction	163
8.1.1	First illustration of the use of Monte-Carlo methods, crude integration	165
8.1.2	Second illustration, particles in a box	169
8.1.3	Radioactive decay	171
8.1.4	Program example for radioactive decay of one type of nucleus	172
8.1.5	Brief summary	174
8.2	Probability distribution functions	174
8.2.1	Multivariable Expectation Values	177
8.2.2	The central limit theorem	179
8.3	Random numbers	180
8.3.1	Properties of selected random number generators	184
8.4	Improved Monte Carlo integration	186
8.4.1	Change of variables	187
8.4.2	Importance sampling	191
8.4.3	Acceptance-Rejection method	193
8.5	Monte Carlo integration of multidimensional integrals	194
8.5.1	Brute force integration	195
8.5.2	Importance sampling	196
8.6	Physics Project: Decay of ^{210}Bi and ^{210}Po	198
8.7	Physics project: Numerical integration of the correlation energy of the helium atom	199
9	Random walks and the Metropolis algorithm	201
9.1	Motivation	201
9.2	Diffusion equation and random walks	202
9.2.1	Diffusion equation	202
9.2.2	Random walks	204
9.3	Microscopic derivation of the diffusion equation	208
9.3.1	Discretized diffusion equation and Markov chains	210
9.3.2	Continuous equations	215
9.3.3	Numerical simulation	216
9.4	Entropy and Equilibrium Features	218
9.5	The Metropolis algorithm and detailed balance	221
9.6	Physics project: simulation of the Boltzmann distribution	224
9.7	Physics project: Random Walk in two dimensions	226
10	Monte Carlo methods in statistical physics	229
10.1	Introduction and motivation	229
10.2	Review of Statistical Physics	231
10.2.1	Microcanonical Ensemble	232
10.2.2	Canonical Ensemble	233
10.2.3	Grand Canonical and Pressure Canonical	234
10.3	Ising model and phase transitions in magnetic systems	235
10.3.1	Theoretical background	235
10.3.2	Phase Transitions	244

Contents

10.4	The Metropolis algorithm and the two-dimensional Ising Model	245
10.5	Selected results for the Ising model	252
10.6	Correlation functions and further analysis of the Ising model	255
10.6.1	Thermalization	255
10.6.2	Time-correlation functions	258
10.7	Physics Project: Thermalization and the One-Dimensional Ising Model	261
10.8	Physics project: simulation of the two-dimensional Ising model	261
10.9	Physics project: Potts Model	262
11	Quantum Monte Carlo methods	265
11.1	Introduction	265
11.2	Postulates of Quantum Mechanics	266
11.2.1	Mathematical Properties of the Wave Functions	266
11.2.2	Important Postulates	267
11.3	First Encounter with the Variational Monte Carlo Method	269
11.4	Variational Monte Carlo for quantum mechanical systems	270
11.4.1	First illustration of variational Monte Carlo methods, the one-dimensional harmonic oscillator 272	
11.5	Variational Monte Carlo for atoms	275
11.5.1	The Born-Oppenheimer Approximation	275
11.5.2	The hydrogen Atom	276
11.5.3	Metropolis sampling for the hydrogen atom and the harmonic oscillator	282
11.5.4	The helium atom	285
11.5.5	Program example for atomic systems	289
11.5.6	Physics Projects: Studies of light Atoms	294
11.5.7	Helium and beyond	296
11.5.8	Physics Projects: Ground state of He, Be and Ne	297
11.6	Simulation of molecular systems	298
11.6.1	The H_2^+ molecule	298
11.6.2	Physics Project: the H_2 molecule	300
12	Eigensystems	303
12.1	Introduction	303
12.2	Eigenvalue problems	303
12.3	Similarity transformations	304
12.4	Jacobi's method	305
12.4.1	Parallel Jacobi algorithm	307
12.5	Diagonalization through the Householder's method for tridiagonalization	307
12.5.1	The Householder's method for tridiagonalization	308
12.5.2	Diagonalization of a tridiagonal matrix	309
12.6	Schrödinger's equation through diagonalization	311
12.6.1	Numerical solution of the Schrödinger equation by diagonalization	313
12.6.2	Program example and results for the one-dimensional harmonic oscillator	314
12.7	Discussion of BLAS and LAPACK functionalities	319
12.8	Physics projects: Bound states in momentum space	319

Contents

13 Differential equations	323
13.1 Introduction	323
13.2 Ordinary differential equations	324
13.3 Finite difference methods	325
13.3.1 Improvements to Euler's algorithm, higher-order methods	327
13.3.2 Predictor-Corrector methods	328
13.4 More on finite difference methods, Runge-Kutta methods	329
13.5 Adaptive Runge-Kutta and multistep methods	331
13.6 Physics examples	332
13.6.1 Ideal harmonic oscillations	332
13.6.2 Damping of harmonic oscillations and external forces	337
13.6.3 The pendulum, a nonlinear differential equation	339
13.6.4 Spinning magnet	341
13.7 Physics Project: the pendulum	342
13.7.1 Analytic results for the pendulum	342
13.7.2 The pendulum code	345
13.8 Physics Project: studies of neutron stars	350
13.8.1 The equations for a neutron star	351
13.8.2 Equilibrium equations	351
13.8.3 Dimensionless equations	352
13.9 Physics project: studies of white dwarf stars	355
13.9.1 Equilibrium equations	356
13.9.2 Dimensionless form of the differential equations	359
13.10 Physics project: Period doubling and chaos	360
14 Two point boundary value problems	363
14.1 Introduction	363
14.2 Shooting methods	364
14.2.1 Improved approximation to the second derivative, Numerov's method	364
14.2.2 Wave equation with constant acceleration	366
14.2.3 Schrödinger equation for spherical potentials	370
14.3 Numerical procedure, shooting and matching	371
14.3.1 Algorithm for solving Schrödinger's equation	372
14.4 Physics projects	374
15 Partial differential equations	377
15.1 Introduction	377
15.2 Diffusion equation	379
15.2.1 Explicit scheme	380
15.2.2 Implicit scheme	384
15.2.3 Crank-Nicolson scheme	387
15.2.4 Numerical truncation	388
15.2.5 Analytic solution for the one-dimensional diffusion equation	389
15.3 Laplace's and Poisson's equations	391
15.3.1 Jacobi Algorithm for solving Laplace's equation	393
15.3.2 Laplace's equation and the parallel Jacobi algorithm	394
15.3.3 Relaxation methods for boundary value problems with parallel implementation	394

Contents

15.4 Wave equation in two dimensions	394
15.4.1 Analytic solution	396
15.5 The Leap frog method and Schrödinger's equation	397
15.6 Physics projects, two-dimensional wave equation	398
15.7 Physics projects, one- and two-dimensional diffusion equations	398
II Advanced topics	401
16 Finite element method	403
17 Modelling Phase Transitions in Statistical Physics	405
18 Quantum Monte Carlo and Bose-Einstein condensation	407
19 Quantum Monte Carlo for atoms and molecules	409
20 Large-scale diagonalization and Coupled-Cluster theories	411
21 Quantum Information Theory and Quantum Algorithms	413
III Programs and additional notes on C++, MPI and Fortran 90/95	415
A Additional C++ and Fortran 90/95 programming features	417
A.1 The vector class	417
A.2 Modules in Fortran 90/95	422
A.3 Debugging of codes	427
A.4 MPI functions and examples	428
A.5 Special functions used in the natural sciences	428
