

Contents

1	Introduction	1
1.1	Choice of programming language	3
1.2	Designing programs	4
2	Introduction to C++ and Fortran	7
2.1	Getting Started	7
2.1.1	Scientific hello world	8
2.2	Representation of Integer Numbers	13
2.2.1	Fortran codes	16
2.3	Real Numbers and Numerical Precision	17
2.3.1	Representation of real numbers	18
2.3.2	Machine numbers	20
2.4	Programming Examples on Loss of Precision and Round-off Errors	22
2.4.1	Algorithms for e^{-x}	22
2.4.2	Fortran codes	25
2.4.3	Further examples	28
2.5	Additional Features of C++ and Fortran	30
2.5.1	Operators in C++	30
2.5.2	Pointers and arrays in C++	32
2.5.3	Macros in C++	34
2.5.4	Structures in C++ and TYPE in Fortran	35
2.6	Exercises	37
3	Numerical differentiation and interpolation	43
3.1	Numerical Differentiation	43
3.1.1	The second derivative of $\exp(x)$	47
3.1.2	Error analysis	56
3.2	Numerical Interpolation and Extrapolation	58
3.2.1	Interpolation	59
3.2.2	Richardson's deferred extrapolation method	62
3.3	Classes in C++	63
3.3.1	The Complex class	65
3.3.2	The vector class	70
3.4	Modules in Fortran	84
3.5	How to Interface C++ programs with Python	88
3.6	How to make Figures with Gnuplot	95
3.7	Exercises	97

4	Non-linear Equations	99
4.1	Particle in a Box Potential	99
4.2	Iterative Methods	100
4.3	Bisection	102
4.4	Newton-Raphson's Method	103
4.5	The Secant Method	107
4.5.1	Broyden's Method	109
4.6	Exercises	110
5	Numerical Integration	113
5.1	Newton-Cotes Quadrature	113
5.2	Adaptive Integration	119
5.3	Gaussian Quadrature	120
5.3.1	Orthogonal polynomials, Legendre	123
5.3.2	Integration points and weights with orthogonal polynomials	125
5.3.3	Application to the case $N = 2$	127
5.3.4	General integration intervals for Gauss-Legendre	128
5.3.5	Other orthogonal polynomials	129
5.3.6	Applications to selected integrals	130
5.4	Treatment of Singular Integrals	132
5.5	Parallel Computing	135
5.5.1	Brief survey of supercomputing concepts and terminologies	135
5.5.2	Parallelism	136
5.5.3	MPI with simple examples	138
5.5.4	Numerical integration with MPI	143
5.6	An Integration Class	147
5.7	Exercises	151
6	Linear Algebra	155
6.1	Introduction	155
6.2	Mathematical Intermezzo	156
6.3	Programming Details	159
6.3.1	Declaration of fixed-sized vectors and matrices	160
6.3.2	Runtime Declarations of Vectors and Matrices in C++	162
6.3.3	Matrix Operations and C++ and Fortran Features of Matrix handling ...	164
6.4	Linear Systems	169
6.4.1	Gaussian Elimination	171
6.4.2	LU Decomposition of a Matrix	174
6.4.3	Solution of Linear Systems of Equations	178
6.4.4	Inverse of a Matrix and the Determinant	179
6.4.5	Tridiagonal Systems of Linear Equations	186
6.5	Spline Interpolation	188
6.6	Iterative Methods	190
6.6.1	Jacobi's method	190
6.6.2	Gauss-Seidel	191
6.6.3	Successive over-relaxation	192
6.6.4	Conjugate Gradient Method	193
6.7	A vector and matrix class	195
6.8	Exercises	205
6.8.1	Solution	208

7	Eigensystems	213
7.1	Introduction	213
7.2	Eigenvalue problems	213
7.3	Similarity transformations	214
7.4	Jacobi's method	215
7.5	Similarity Transformations with Householder's method	220
7.5.1	The Householder's method for tridiagonalization	220
7.5.2	Diagonalization of a Tridiagonal Matrix via Francis' Algorithm	224
7.6	Power Methods	225
7.7	Schrödinger's Equation Through Diagonalization	226
7.7.1	Numerical solution of the Schrödinger equation by diagonalization	228
7.7.2	Program example and results for the one-dimensional harmonic oscillator	229
7.8	Exercises	233
8	Differential equations	239
8.1	Introduction	239
8.2	Ordinary differential equations	240
8.3	Finite difference methods	241
8.3.1	Improvements of Euler's algorithm, higher-order methods	243
8.3.2	Predictor-Corrector methods	244
8.4	More on finite difference methods, Runge-Kutta methods	245
8.5	Physics examples	247
8.5.1	Ideal harmonic oscillations	247
8.5.2	Damping of harmonic oscillations and external forces	252
8.5.3	The pendulum, a nonlinear differential equation	254
8.6	Physics Project: the pendulum	256
8.6.1	Analytic results for the pendulum	256
8.6.2	The pendulum code	260
8.7	Exercises	264
9	Two point boundary value problems	273
9.1	Introduction	273
9.2	Shooting methods	274
9.2.1	Improved approximation to the second derivative, Numerov's method	274
9.2.2	Wave equation with constant acceleration	276
9.2.3	Schrödinger equation for spherical potentials	279
9.3	Numerical procedure, shooting and matching	281
9.3.1	Algorithm for solving Schrödinger's equation	282
9.4	Green's function approach	284
9.5	Exercises	287
10	Partial differential equations	291
10.1	Introduction	291
10.2	Diffusion equation	293
10.2.1	Explicit Scheme	294
10.2.2	Implicit Scheme	298
10.2.3	Crank-Nicolson scheme	301
10.2.4	Numerical Truncation	303
10.2.5	Solution for the One-dimensional Diffusion Equation	304
10.3	Laplace's and Poisson's Equations	305
10.3.1	Jacobi Algorithm for solving Laplace's Equation	306
10.4	Wave Equation in two Dimensions	308

10.4.1 Closed-form Solution	309
10.5 Exercises	311
11 Outline of the Monte Carlo Strategy	319
11.1 Introduction	319
11.1.1 Definitions	321
11.1.2 First Illustration of the Use of Monte-Carlo Methods	324
11.1.3 Second Illustration, Particles in a Box	328
11.1.4 Radioactive Decay	331
11.1.5 Program Example for Radioactive Decay	331
11.1.6 Brief Summary	333
11.2 Probability Distribution Functions	333
11.2.1 Multivariable Expectation Values	336
11.2.2 The Central Limit Theorem	338
11.2.3 Definition of Correlation Functions and Standard Deviation	340
11.3 Random Numbers	341
11.3.1 Properties of Selected Random Number Generators	344
11.4 Improved Monte Carlo Integration	346
11.4.1 Change of Variables	347
11.4.2 Importance Sampling	351
11.4.3 Acceptance-Rejection Method	352
11.5 Monte Carlo Integration of Multidimensional Integrals	353
11.5.1 Brute Force Integration	354
11.5.2 Importance Sampling	355
11.6 Classes for Random Number Generators	357
11.7 Exercises	358
12 Random walks and the Metropolis algorithm	363
12.1 Motivation	363
12.2 Diffusion Equation and Random Walks	364
12.2.1 Diffusion Equation	364
12.2.2 Random Walks	367
12.3 Microscopic Derivation of the Diffusion Equation	369
12.3.1 Discretized Diffusion Equation and Markov Chains	371
12.3.2 Continuous Equations	375
12.3.3 Numerical Simulation	377
12.4 Entropy and Equilibrium Features	379
12.5 The Metropolis Algorithm and Detailed Balance	381
12.5.1 Brief Summary	385
12.6 Langevin and Fokker-Planck Equations	386
12.6.1 Fokker-Planck Equation	386
12.6.2 Langevin Equation	389
12.7 Exercises	391
13 Monte Carlo Methods in Statistical Physics	395
13.1 Introduction and Motivation	395
13.2 Review of Statistical Physics	397
13.2.1 Microcanonical Ensemble	398
13.2.2 Canonical Ensemble	399
13.2.3 Grand Canonical and Pressure Canonical	400
13.3 Ising Model and Phase Transitions in Magnetic Systems	401
13.3.1 Theoretical Background	401

13.4 Phase Transitions and Critical Phenomena	409
13.4.1 The Ising Model and Phase Transitions	410
13.4.2 Critical Exponents and Phase Transitions from Mean-field Models	412
13.5 The Metropolis Algorithm and the Two-dimensional Ising Model	414
13.5.1 Parallelization of the Ising Model	420
13.6 Selected Results for the Ising Model	422
13.7 Correlation Functions and Further Analysis of the Ising Model	425
13.7.1 Thermalization	425
13.7.2 Time-correlation Function	428
13.8 The Potts' model	431
13.9 Exercises	432
14 Quantum Monte Carlo Methods	437
14.1 Introduction	437
14.2 Postulates of Quantum Mechanics	438
14.2.1 Mathematical Properties of the Wave Functions	438
14.2.2 Important Postulates	439
14.3 First Encounter with the Variational Monte Carlo Method	440
14.4 Variational Monte Carlo for Quantum Mechanical Systems	442
14.4.1 First illustration of Variational Monte Carlo Methods	444
14.5 Variational Monte Carlo for atoms	446
14.5.1 The Born-Oppenheimer Approximation	447
14.5.2 The Hydrogen Atom	448
14.5.3 Metropolis sampling for the hydrogen atom and the harmonic oscillator	452
14.5.4 The Helium Atom	455
14.5.5 Program Example for Atomic Systems	460
14.5.6 Importance sampling	466
14.6 Exercises	468
15 Many-body approaches to studies of electronic systems: Hartree-Fock theory 473	
15.1 Introduction	473
15.2 Hartree-Fock theory	475
15.3 Expectation value of the Hamiltonian with a given Slater determinant	478
15.4 Derivation of the Hartree-Fock equations	480
15.4.1 Reminder on calculus of variations	480
15.4.2 Varying the single-particle wave functions	483
15.4.3 Detailed solution of the Hartree-Fock equations	484
15.4.4 Hartree-Fock by variation of basis function coefficients	487
15.5 Exercises	490
16 Improved Monte Carlo Approaches to Systems of Fermions 493	
16.1 Introduction	493
16.2 Splitting the Slater Determinant	493
16.3 Computational Optimization of the Metropolis/Hasting Ratio	494
16.3.1 Evaluating the Determinant-determinant Ratio	494
16.4 Optimizing the $\nabla\Psi_T/\Psi_T$ Ratio	496
16.4.1 Evaluating the Gradient-determinant-to-determinant Ratio	496
16.5 Optimizing the $\nabla^2\Psi_T/\Psi_T$ Ratio	497
16.6 Updating the Inverse of the Slater Matrix	498
16.7 Reducing the Computational Cost of the Correlation Form	498
16.8 Computing the Correlation-to-correlation Ratio	499
16.9 Evaluating the $\nabla\Psi_C/\Psi_C$ Ratio	499

16.9.1 Special Case: Correlation Functions Depending on the Relative Distance	500
16.1 Computing the $\nabla^2\Psi_C/\Psi_C$ Ratio	501
16.1 Efficient Optimization of the Trial Wave Function	503
16.1 Exercises	504
17 Bose-Einstein condensation and Diffusion Monte Carlo	511
17.1 Diffusion Monte Carlo	511
17.1.1 Importance Sampling	515
17.2 Bose-Einstein Condensation in Atoms	517
17.3 Exercises	519
References	522
