

I_{set} vs Optical Power For Opto-board BeO1

Optical power characterization of the opto-board as measured by JimB

BeO Thresholds

See JimB's Notes on the next slide

Notes

- No caps on compensation inputs
- I_{pin} varied by attenuator, rather than I_{set} , $I_{\text{set}}(\text{board})=0.13\text{mA}$ seems low
- For the measurements where the other links were off, measured with drivers turned on for other links, but PINs dark (fiber disconnected)
