

On or around December 14th and continuing throughout the Holiday break, FOD will have a dumpster and a debris chute positioned as shown. Contractors will be working on the roof to remove damaged insulation that was blown off of a large area of external ductwork during the windstorm of September 2008.

The repair project has had an extended duration due to the use of FEMA funds made available by the Federal Government to the University and by a design change from the original insulation type.

Debris removal will be done during break and insulation will be installed in the Spring of 2010. Physics Department members are asked to refrain from putting any material in the dumpsters. During the work period, there will be no access to the trash room and to the existing dumpster.
